Submission date: May 6, 2016	Version nr: 1

## **Report for Deliverable 1.12 (D1.12): Beta version of enhanced gridding software available to project partners**

**By Richard Cornes<sup>1 and 2</sup> and Phil Jones<sup>2</sup>**

<sup>1</sup> KNMI, Netherlands

<sup>2</sup> Climatic Research Unit, School of Environmental Sciences, University of East Anglia, Norwich, UK

The original gridding software used for E-OBS was written in Fortran. To allow for the developments of the E-OBS under the UERRA project (some of which are described in Deliverable D1.10) and to improve the efficiency of the code, a new software package has been produced, written in the R programming language (R Development Core Team, 2008). In the first instance this software package replicates the methods used in the original Fortran code, but the software also includes many additional functions that achieve the objectives being conducted under UERRA of improving and developing the E-OBS dataset. The use of this programming language allows easier dissemination of the software to project partners and ultimately to the wider research community. The manual for the package “eobs” is included in the Appendix of this document and the software, currently in restricted beta form and only for use by project partners, is available on request to Richard Cornes at KNMI ([cornes@knmi.nl](mailto:cornes@knmi.nl)).

The software package is designed to allow the gridding procedures used in E-OBS to make greater use of parallel computing, which greatly reduces the time taken to complete a new run of the E-OBS dataset. This allows more computationally intensive procedures to be incorporated into the gridding procedures (such as the regression kriging technique described in deliverable D1.10) without significantly lengthening the time taken to complete a gridding run.

The code used in the “eobs” R package is currently being run on the high-performance computing cluster (HPCF) at the European Centre for Medium-Range Weather Forecasts (ECMWF). The running of the scripts is largely automated through the use of the ECTRANS suite of programs. This marks a significant development in the gridding of the E-OBS dataset: in the first instance the runtime for the gridding jobs is reduced from a few weeks to a few days, but the use of this cluster will allow more intensive gridding procedures to be used in the future. The prime example of this is the generation of an ensemble of realizations, which will be the subject of Deliverable D1.14.

## Appendix: Manual for the “eobs” R package

### Package ‘eobs’

May 6, 2016

**Title** Functions to grid station-based climate data

**Version** 0.1

**Author** “Richard Cornes <cornes@knmi.nl> [aut, cre]”

**Maintainer** Richard Cornes <cornes@knmi.nl>

**Description** A collection of functions for the gridding of station data using the approach used in the E-OBS dataset. The gridding is done using thin-plate splines for monthly data, with the daily data being gridded using kriging. The functions are optimized for use on a computing cluster, principally by allowing the gridding to be split by months, i.e. each month of data may be sent to a separate computing node for processing. However, the functions will also run without such computing infrastructure.

**Depends** R (>= 3.0.0), methods

**Imports** data.table (>= 1.9.2), foreach, reshape, raster (>= 2.4-20), gstat, fields (>= 8.2-1), LatticeKrig (>= 5.4-1), rgcvpack (>= 0.1-4), lubridate (>= 1.5.0), sp (>= 1.2-1), rts (>= 1.0-10)

**License** file LICENSE

**LazyData** true

**Suggests** geosphere, lmomco, fitdistrplus, knitr, yaml, doParallel, mgcv (>= 1.8-4), snow (>= 0.4-1)

**NeedsCompilation** yes

**VignetteBuilder** knitr

**RoxygenNote** 5.0.1

eobs-package	<i>Grid climate data using the E-OBS scheme</i>
--------------	---

---

## Description

eobs provides a suite of tools to allow gridding of station-based climate data using the techniques used for the E-OBS dataset produced by the ECA&D group at KNMI.

## Details

The original code used to produce E-OBS, and described by Haylock et al. (2008), was written in Fortran. To allow extensions to the code and to make the code more efficient this package was written to reproduce the output of the Fortran code. Clearly there will be certain differences, but testing has revealed that these are relatively minor. The functions in this package make extensive use of the raster and sp packages, with the kriging functions being based on functions from the gstat package.

The gridding functions operate on time slices of the data, which are referred to as "periods". The value of the period depends on the time frame from which the daily anomalies are calculated. Typically the periods will be months, but they could be an time slice up to a year. This slicing allows parallelization of the gridding by simultaneously gridding the years/periods.

*clusterAverage*

3

---

<i>clusterAverage</i>	<i>Average stations within a specified distance.</i>
-----------------------	--

---

**Description**

This function uses the [zerodist](#) function to define clusters of stations, which are then averaged, i.e. the distance variable is used as the zero variable in that function. As a result the unit of distance depends on the coordinates specified in *obj*, which for longitude/latitude is KM. The default value of 1 matches the range used in the original E-OBS gridding code.

**Usage**

```
clusterAverage(obj, distance = 1, cluster_only = FALSE)
```

**Arguments**

<i>obj</i>	An object of class <a href="#">SpatialPointsDataFrame</a>
<i>distance</i>	The distance over which averaging should take place.
<i>cluster_only</i>	If TRUE only the cluster identifier is returned

**Value**

A [SpatialPointsDataFrame](#)

**Author(s)**

Richard Cornes

4

*dayGrid*

---

combine.vg	<i>Average daily semi-variograms</i>
------------	--------------------------------------

---

**Description**

Average daily semi-variograms

**Usage**

combine.vg(ifiles)

**Arguments**

ifiles                      A list of .RDS files containing the variograms

**Details**

This simple function averages each of the daily variograms produced by the function 'semi.VG'. This is the method that was originally used in the E-OBS dataset (see Haylock et al., 2008).

**Value**

The averaged variogram of class data.table

**Author(s)**

Richard Cornes

---

dayGrid	<i>Grid Daily Anomalies using kriging</i>
---------	---

---

**Description**

This function uses the *krige* function from the *gstat* package to interpolate the daily anomalies to a gridded format. The monthly gridded absolute values are then added back to the anomalies to form the final daily values.

**Usage**

dayGrid(obj, ...)

## S4 method for signature 'eobs'

```
dayGrid(obj, MonGrid, vg.dat, verbose = TRUE, nbmax = 75,
        maxdist = 500, cl = NULL)
```

## S4 method for signature 'eobs\_rain'

```
dayGrid(obj, MonGrid, vg.dat, vg.prob, verbose = TRUE,
        nbmax = 75, maxdist = 450, ind_prob = 0.4, thresh = 0.5, cl = NULL)
```

*dayGrid*

5

**Arguments**

<code>obj</code>	An object of class <code>eobs</code>
<code>...</code>	Parameters passed to respective functions
<code>MonGrid</code>	An object of class <code>SpatialPointsDataFrame</code> containing the gridded monthly data
<code>vg.dat</code>	An object of class <code>gstatVariogram</code> containing the variogram of the daily anomalies. This will probably have been derived from a call to <code>semiVG</code>
<code>verbose</code>	If TRUE intermediate messages will be printed
<code>nbmax</code>	The maximum number of neighbours to be used in kriging. This will be passed to the <code>krige</code> function in the <code>gstat</code> package
<code>maxdist</code>	The maximum distance to be used in kriging. This will be passed to the <code>krige</code> function in the <code>gstat</code> package
<code>cl</code>	A cluster object
<code>vg.prob</code>	An object of class <code>gstatVariogram</code> containing the variogram of the daily probability of rainfall. This will probably have been derived from a call to <code>semiVG</code>
<code>ind_prob</code>	The threshold used in the final gridded data to define a wet-day (see Haylock et al. 2008)
<code>thresh</code>	The threshold used to define a wet-day (see Haylock et al. 2008)

**Value**

An object of `SpatialPointsDataFrame` containing the daily gridded monthly data

**Methods (by class)**

- `eobs`: For class "eobs"
- `eobs_rain`: For class "eobs\_rain"

**Author(s)**

Richard Cornes

**See Also**

`gridTPS`, `krige`

6

eobs-class

---

daysinperiod	<i>Days in the Year/Period</i>
--------------	--------------------------------

---

**Description**

Get a vector of days in the given Year/Period

**Usage**

daysinperiod(obj, Year, Period)

**Arguments**

obj	Object of class eobs
Year	The year in question
Period	The period in question

**Value**

Vector of class "POSIXct" "POSIXt"

**Author(s)**

Richard Cornes

---

eobs-class	<i>An S4 class for eobs general variables</i>
------------	---

---

**Description**

An S4 class for eobs general variables

**Slots**

lon_rng	Longitude range vector
lat_rng	Latitude range vector
var	Name of the variable
rain	Logical indicating if rain is being gridded
base	Base period range
yrs	Year range
periods	The period definition
grid	The high-resolution grid
stn	A spatial dataframe of station data
data	The current station data being processed
stn.id	A vector of unique station references

*fields*

7

---

<i>fields</i>	<i>Gridding using the Tps function</i>
---------------	--

---

**Description**

As [rgcv](#) but using the thin-plate spline functions from the *fields* package

**Usage**

```
fields(obj, yvar = "VarSum", rhs = ~lon + lat + I(alt/1000), cost = 1,
       Z = NULL, rev.trans = TRUE, se.fit = FALSE, cl = NULL, ...)
```

**Arguments**

<code>obj</code>	Object of class <i>eobs</i> or one of its derivatives
<code>yvar</code>	The left-hand side of the equation as a character string
<code>rhs</code>	The right-hand side of the equation as a formula
<code>cost</code>	Cost function supplied to <code>fitTps</code> function
<code>Z</code>	The Z component passed to the <i>Tps</i> function
<code>rev.trans</code>	If TRUE the values are converted back from a transformed state. For example, in the default case the values are returned as square-roots of the gridded values.
<code>se.fit</code>	If FALSE standard error values are not calculated
<code>cl</code>	A cluster object
<code>...</code>	Further parameters passed to the spline fitting function function

**Value**

An object of class *SpatialPointDataFrame*

**Author(s)**

Richard Cornes

**See Also**

[rgcv](#), [gridTPS](#), [Tps](#)

Other TPS.functions: [gam.hybrid](#), [gridTPS](#), [lkrig](#), [rgcv](#), [tprs](#)

8

*gam.hybrid*

---

gam.hybrid	<i>Gridding using Regression-kriging</i>
------------	--

---

**Description**

Gridding using Regression-kriging

**Usage**

```
gam.hybrid(obj, tprs.run, gam.res, lzn.fit, maxdist = 500, nmax = 15,
  nmin = 4, nsim = 0, cl = NULL)
```

**Arguments**

obj	Object of class eobs or one of its derivatives
tprs.run	The list returned from a call to a tps function
gam.res	The residuals from the tps function
lzn.fit	The variogram fitted to the residuals
maxdist	Maximum search radius in the <i>krige</i> function
nmax	Maximum points in the <i>krige</i> function
nmin	Minimum points in the <i>krige</i> function
nsim	Number of simulations used in Maximum points in the <i>krige</i> function
cl	A cluster object

**Value**

An object of class SpatialPointDataFrame

**Author(s)**

Richard Cornes

**See Also**[gridTPS](#)Other TPS.functions: [fields](#), [gridTPS](#), [lkrig](#), [rgcv](#), [tprs](#)

*get\_meta*

9

---

<i>get_meta</i>	<i>Internal S4 Generic for extracting a spline's meta-data</i>
-----------------	--

---

**Description**

Internal S4 Generic for extracting a spline's meta-data

**Usage**

```
get_meta(obj, ...)

## S4 method for signature 'gam'
get_meta(obj)

## S4 method for signature 'bam'
get_meta(obj)

## S4 method for signature 'Krig'
get_meta(obj)

## S4 method for signature 'LKrig'
get_meta(obj)

## S4 method for signature 'LatticeKrig'
get_meta(obj)

## S4 method for signature 'Tps'
get_meta(obj)
```

**Arguments**

<i>obj</i>	Spline class obtained from a call to <a href="#">gridTPS</a>
<i>...</i>	Other values passed to the meta function

**Author(s)**

Richard Cornes

---

<i>gridTPS</i>	<i>Grid the [monthly] station data</i>
----------------	--

---

**Description**

This is a convenience function that applies one of the selected gridding procedures to the station data.

10

*gridTPS***Usage**

```
gridTPS(obj, method = c("rgcv", "fields", "lkrig", "tprs", "gam.hybrid"),
        verbose = TRUE, ...)
```

**Arguments**

<code>obj</code>	Object of class <code>eobs</code> or one of its derivatives
<code>method</code>	The spline method to be used
<code>verbose</code>	If TRUE intermediate messages will be printed
<code>...</code>	Parameters passed to the respective spline functions

**Details**

The formula used for the spline model is built using the `yvar` and `rhs` components, and provides a great deal of flexibility in the model fitting. For example, using the default components the following model is fitted

$$y^2 = f(lon, lat, alt)$$

where `alt` is scaled by 1000. This is the recommended value for a thin-plate spline fitted to longitude and latitude values scaled in degrees, and altitude values initially in metres are scaled in kilometres.

If a valid cluster object is supplied then the prediction is split across the cluster nodes. This will give a significant speed-up of the function. The cluster object (`cl`) is that required by the `clusterSplit` function. For parallel processing to occur the cluster object needs to be registered such that the `foreach` function can operate in parallel.

The values are predicted at either the GRID locations or at the `stn.test` locations: one of these options must be selected. If `stn.test` are specified then these locations are removed from the locations used in the spline fitting. This function grids station data using a thin-plate regression spline method from the `mgcv` package.

**Value**

An object of class `SpatialPointDataFrame`

**Author(s)**

Richard Cornes

NLhires

**See Also**[gridTPS](#), [LatticeKrig](#)Other TPS.functions: [fields](#), [gam.hybrid](#), [gridTPS](#), [rgcv](#), [tprs](#)

NLgriddata

*Dutch Rainfall Gridding Data***Description**

In these data the NLRainfall data have been processed by `prep_data` and the results have been amalgamated into `data.tables` which contain the results for all stations. These data can then be processed using the gridding routines in this package

**Usage**

NLgriddata

**Format**

A list 3 components:

**day** A data.table containing the daily data**month** A data.table containing the monthly data**climate** A data.table containing the climatology data

NLhires

*Dutch High-resolution topography***Description**

Elevation data for the Netherlands taken from the `gtopo30` dataset. These data have been resampled to 0.1 degree resolution and the coordinates have been transformed. This is a section of the high-resolution data for Europe used in the original version of E- OBS

**Usage**

NLhires

**Format**A *\*raster\** object with 1 variables:**alt** Altitude in metres**Source**<https://lta.cr.usgs.gov/GTOPO30>

NLRainfall

13

---

NLRainfall	<i>Daily Rainfall Totals</i>
------------	------------------------------

---

**Description**

A dataset containing daily rainfall totals from 37 automatic weather stations (AWS) across the Netherlands, over the period 1950-99. Note that certain stations may contain data for the full period. In the original data values > 0.5mm are marked as -1. These trace values have been changed here to zero.

**Usage**

NLRainfall

**Format**

A data frame with 344754 rows and 3 variables:

**STATION** Unique station ID number

**YYYYMMDD** Date, in the format year, month, day

**VALUE** Daily Rainfall Total in mm

**Source**

[http://www.knmi.nl/climatology/daily\\_data/selection.cgi](http://www.knmi.nl/climatology/daily_data/selection.cgi)

---

NLStations	<i>Dutch AWS Station Meta-data</i>
------------	------------------------------------

---

**Description**

A dataset containing meta-data from the 37 automatic weather stations across the Netherlands

**Usage**

NLStations

**Format**

A data frame with 37 rows and 6 variables:

**ID** Unique station ID number

**LAT** Station Latitude in decimal degrees North

**LON** Station Longitude in decimal degrees East

**ALT** Station Altitude in metres

**STATION\_NAME** Name of the station

**COUNTRY\_NAME** Country of the station - always NL

prep_data	<i>Data Preparation S4 Generic</i>
-----------	------------------------------------

---

**Description**

Data Preparation S4 Generic

**Usage**

```
prep_data(obj, ...)

## S4 method for signature 'eobs'
prep_data(obj, dat, id, nthresh = 0.2, baseThresh = 0,
  climateThresh = baseThresh, verbose = TRUE, ...)

## S4 method for signature 'eobs_rain'
prep_data(obj, dat, id, nthresh = 0.2, baseThresh = 0,
  climateThresh = baseThresh, verbose = TRUE, trace = 0.05,
  gammaFunc = c("GammaFunc.lmom", "GammaFunc.censor", "GammaFunc.SCI"), ...)

## S4 method for signature 'eobs_dtr'
prep_data(obj, tmax, tmin, id, nthresh = 0.2,
  baseThresh = 0, climateThresh = baseThresh, verbose = TRUE, ...)

## S4 method for signature 'eobs_tmn'
prep_data(obj, tmax, tmin, id, nthresh = 0.2,
  baseThresh = 0, climateThresh = baseThresh, verbose = TRUE, ...)
```

**Arguments**

obj	Object of class eobs
...	Parameters passed to respective functions
dat	data.frame with the following columns: year,month,day,var
id	The unique station id
nthresh	Threshold of missing values tolerated. Defaults to 0.2, i.e. <20% values tolerated
baseThresh	The proportion of missing values permitted in the base-period calculations. Defaults to zero, i.e. must be complete
climateThresh	The proportion of missing values permitted in the climatology calculations. Defaults to the same value as baseThresh
verbose	If true messages are printed to screen

*prep\_data*

15

trace	Values below which rainfall is treated as missing
gammaFunc	The gamma function to use. Either <code>GammaFunc.censor</code> or <code>GammaFunc.lmom</code>
tmax	Maximum daily temperature data.frame
tmin	Minimum daily temperature data.frame

**Value**

List containing data.tables under the titles: day, month and param, respectively daily and monthly processed data and parameters by period.

**Methods (by class)**

- eobs: class "eobs"
- eobs\_rain: class "eobs\_rain"
- eobs\_dtr: class "eobs\_dtr"
- eobs\_tmn: class "eobs\_tg"

**Author(s)**

Richard Cornes

**Examples**

```
library(data.table)
data(NLRainfall)
data(NLStations)

## Initiate the eobs class
NL <- startEOBS(c(3.27,7.43),c(50.9,53.8),c(1981,2010),c(1971,2014),1:12,var="rr")
stns <- NLStations$ID

## Select one station
id <- 210
raw <- NLRainfall[NLRainfall$STATION==id,]
yrs <- as.numeric(substr(raw$YYYYMMDD,1,4))
mons <- as.numeric(substr(raw$YYYYMMDD,5,6))
days <- as.numeric(substr(raw$YYYYMMDD,7,8))
dat <- data.table(year=yrs, month=mons, day=days, var=raw$VALUE)

## Calculate the statistics
stats <- prep_data(NL, dat, id)
```

16

regrid

readECAD.full	Read ECA&D data file
---------------	----------------------

**Description**

Read and process the contents of an ECA&D full data file

**Usage**

readECAD.full(dat, QC = TRUE, verbose = TRUE)

**Arguments**

- datData.frame in ECAD format
- QCIf TRUE values classified by ECA&D QC as suspect are removed. Applies to any QC code >0
- verboseIf TRUE prints debugging messages

**Value**

data.table with columns date, var and id

**Author(s)**

Richard Cornes

regrid	Regridding using box averaging S4 Generic
--------	---

**Description**

Regridding using box averaging S4 Generic

**Usage**

```
regrid(obj, ogrid, ...)

## S4 method for signature 'RasterLayer'
regrid(obj, ogrid, ...)

## S4 method for signature 'RasterBrickTS'
regrid(obj, ogrid, ...)
```

*regrid\_rot*

17

#### Arguments

obj	An object of class *raster* containing data to be regridded
ogrid	An object of class *raster* containing the output grid
...	Not Currently used

#### Methods (by class)

- RasterLayer: For class "RasterLayer"
- RasterBrickTS: For class "RasterBrickTS"

#### Author(s)

Richard Cornes

---

*regrid\_rot*

*Regridding using the "chain" method S4 Generic*

---

#### Description

Regridding using the "chain" method S4 Generic

#### Usage

```
regrid_rot(obj, ogrid, ...)

## S4 method for signature 'RasterLayer'
regrid_rot(obj, ogrid, ...)

## S4 method for signature 'RasterBrickTS'
regrid_rot(obj, ogrid, ...)
```

#### Arguments

obj	An object of class *raster* containing data to be regridded
ogrid	An object of class *raster* containing the output grid
...	Not Currently used

#### Methods (by class)

- RasterLayer: For class "RasterLayer"
- RasterBrickTS: For class "RasterBrickTS"

#### Author(s)

rgcv

---

reverse_gamma	<i>Reverse Gamma Transform</i>
---------------	--------------------------------

---

**Description**

Reverse the Gamma Transform used in gridding rainfall. This is a simple wrapper for [qgamma](#)

**Usage**

```
reverse_gamma(prob, shape, scale)
```

**Arguments**

prob	A vector of probabilities
shape	A vector of shape parameters
scale	A vector of scale parameters

**Value**

Vector

**Author(s)**

Richard Cornes

---

rgcv	<i>Gridding using the fitTps function</i>
------	---

---

**Description**

Produce Thin-Plate Spline interpolation using the [fitTps](#) function from the [rgcvpack](#) package. This produces a result very close to the original Fortran e-obs gridding code.

**Usage**

```
rgcv(obj, yvar = "VarSum^2", rhs = ~lon + lat + I(alt/1000), cost = 1,
     rev.trans = TRUE, cl = NULL, ...)
```

*semiVG*

19

**Arguments**

<code>obj</code>	Object of class <code>eobs</code> or one of its derivatives
<code>yvar</code>	The left-hand side of the equation as a character string
<code>rhs</code>	The right-hand side of the equation as a formula
<code>cost</code>	Cost function supplied to <code>fitTps</code> function
<code>rev.trans</code>	If TRUE the values are converted back from a transformed state. For example, in the default case the values are returned as square-roots of the gridded values.
<code>cl</code>	A cluster object
<code>...</code>	Further parameters passed to the spline fitting function

**Value**

An object of class `SpatialPointDataFrame`

**Author(s)**

Richard Cornes

*semiVG**Variogram S4 Generic***Description**

Using the `gstat` 'variogram' function, produce the semi-variogram for each day of data and write the parameters to file. The intention is then that these daily semi-variograms are then compiled with the function `combine.vg`. This is the method that was originally used in the E-OBS dataset (see Haylock et al., 2008).

**Usage**

```
semiVG(obj, ...)
```

```
## S4 method for signature 'eobs'
```

```
semiVG(obj, form = anom ~ 1, Nlags = 20, cutoff = 500)
```

```
## S4 method for signature 'eobs_dtr'
```

```
semiVG(obj, form = anom ~ 1, Nlags = 20,
```

```
      cutoff = 500)
```

```
## S4 method for signature 'eobs_tmn'
```

20

*semiVG*

```
semiVG(obj, form = anom ~ 1, Nlags = 20,
        cutoff = 500)
```

```
## S4 method for signature 'eobs_rain'
semiVG(obj, form = anom ~ 1, Nlags = 20,
        thresh = 0.5, cutoff = 450)
```

**Arguments**

<code>obj</code>	Object of class <code>eobs</code>
<code>...</code>	Parameters passed to respective functions
<code>form</code>	The formula that is passed to <code>gstat::variogram</code>
<code>Nlags</code>	Produces the width parameter in variogram such that <code>width=cutoff/Nlags</code>
<code>cutoff</code>	Seperation range
<code>thresh</code>	Value indicating a trace of rainfall

**Value**

NULL, but has the side effect of writing to file

**Methods (by class)**

- `eobs`: For class "eobs"
- `eobs_dtr`: For class "eobs\_dtr"
- `eobs_tmn`: For class "eobs\_tg"
- `eobs_rain`: For class "eobs\_rain"

**Author(s)**

Richard Cornes

**Examples**

```
## Not run:

data(NLgriddata)
data(NLStations)
data(NLhires)

get_VG <- function(idata){

  ## Add the station meta (including coordinates)
  idata <- meta[idata]

  ## Construct a SpatialPointsDataFrame
```

```
set_data<-
```

21

```

coordinates(idata) <- ~LON+LAT
proj4string(idata) <- CRS("+proj=longlat +ellps=WGS84")

set_data(NL) <- idata

semiVG(NL)
}

## Set the eobs class
NL <- startEOBS(c(3.27,7.43),c(50.9,53.8),c(1981,2010),c(1971,2014),1:12,var="rr")
hires <- rasterToPoints(NLhires,spatial=TRUE)
set_grid(NL) <- hires

## Get the station meta-data
meta <- data.table(NLStations)
meta[,c("COUNTRY_NAME","STATION_NAME"):=NULL]
setkey(meta,ID)

## Run the variogram over each day of the year 2000
day_data <- NLgriddata$day
setkey(day_data,id)
DT <- day_data[year==2000,get_VG(.SD),by=c("year","month","day")]

## Average the variograms
vg <- DT[,lapply(.SD,mean,na.rm=TRUE),
.SDcols=c("np","dist","gamma","dir.hor","dir.ver"),
by=c("variable","N")]

class(vg) <- "gstatVariogram"

## End(Not run)

```

---

```
set_data<-
```

```
set_data
```

---

### Description

This is a replacement function that takes a Spatial Points Dataframe consisting of the station data and assigns it to the eobs S4 object. If lat\_rng and lon\_rng have been specified in the eobs class then the station data will first be clipped to that extent. Following that the data are reprojected onto the same grid as the high-resolution grid. For this reason `set_grid<-` must be called before this function. This function also averages stations within a radius that is set by the variable distance when calling `startEOBS`.

A replacement function to set the high-resolution grid to the eobs S4 class

### Usage

```
set_data(obj) <- value
```

22

*startEOBS*

```
## S4 replacement method for signature 'eobs'
set_data(obj) <- value

set_grid(obj) <- value

## S4 replacement method for signature 'eobs'
set_grid(obj) <- value
```

**Arguments**

<code>obj</code>	Object of class 'eobs' or one of its derivatives
<code>value</code>	A spatial points dataframe that consists of the station data
<code>value</code>	A spatial points dataframe that consists of the high-resolution grid that will be interpolated to.

**Note**

The high-resolution interpolation grid must first be set with `set_grid<-`.

---

<code>startEOBS</code>	<i>Initiate the eobs project</i>
------------------------	----------------------------------

---

**Description**

Initiate the 'eobs' S4 class

**Usage**

```
startEOBS(lon_rng, lat_rng, base, yrs, periods, distance = 1, var = c("rr",
  "tx", "tn", "dtr", "tg", "tmn", "pp"), ...)
```

*startEOBS.yaml*

23

#### Arguments

lon_rng	A vector of length two specifying the longitude extent
lat_rng	A vector of length two specifying the latitude extent
base	A vector of length two specifying the base period
yrs	A vector specifying the unique years to be gridded. Must be consecutive
periods	A vector of length 12 specifying the period configuration
distance	The distance over which over which station values are averaged
var	The name of the variable being gridded
...	Not currently used

#### Value

S4 object of class eobs or a derivative

#### Author(s)

Richard Cornes

#### Examples

```
## An E-OBS gridding class for rainfall across the Netherlands
NL <- startEOBS(c(3.27,7.43),c(50.9,53.8),c(1961,1990),1950:1999,1:12,var="rr")
```

---

startEOBS.yaml	<i>eobs class from a yaml file</i>
----------------	------------------------------------

---

#### Description

Construct an eobs class from a yaml file

#### Usage

```
startEOBS.yaml(yfile, ...)
```

#### Arguments

yfile	The path to the yaml file
...	Other options required by the <code>yaml.load_file</code> function

#### Details

This is a simple wrapper for `startEOBS`, which enables an eobs class to be constructed from a suitable yaml file.

24	test.stns
<b>Value</b>	An object of class 'eobs' or one of its derivatives
<b>Author(s)</b>	Richard Cornes
<b>See Also</b>	<code>yaml.load_file</code>
<b>station_test</b>	<i>station_test</i>
<b>Usage</b>	<pre>station_test(obj)  ## S4 method for signature 'eobs' station_test(obj)</pre>
<b>Arguments</b>	<code>obj</code> Object of class 'eobs' or one of its derivatives
<b>Methods (by class)</b>	<ul style="list-style-type: none"><li>eobs: For class eobs</li></ul>
<b>Author(s)</b>	Richard Cornes
<b>test.stns</b>	<i>Select appropriate test stations</i>
<b>Description</b>	Select appropriate test stations
<b>Usage</b>	<pre>test.stns(eobs, cands, N = 100, homogFile = NULL, HomogSel = c("USEFUL",   "DOUBTFUL", "SUSPECT"), thresh = 0.95, verbose = TRUE,   save.knots = TRUE, ...)</pre>

*test.stns*

25

**Arguments**

<code>eobs</code>	An object of class <code>eobs</code>
<code>cands</code>	A <code>data.frame</code> (or <code>data.table</code> ) that contains the latitudes and longitudes of the candidate stations. These must be named columns in the form "lat" and "lon"
<code>N</code>	Number of stations to select. This is passed as the <code>nd</code> parameter in the function <code>cover.design</code> from the <code>fields</code> package
<code>homogFile</code>	Path to the file containing the homogeneity information
<code>HomogSel</code>	The homogeneity criterion
<code>thresh</code>	Completeness threshold
<code>verbose</code>	If TRUE print messages to screen
<code>save.knots</code>	If TRUE the <code>data.table</code> containing the selection of stations is written to an RDS file using <code>saveRDS</code> . The location of this file is as specified in the <code>knotFile</code> slot of the <code>eobs</code> class.
<code>...</code>	Further options passed to the <code>fields</code> function <code>cover.design</code> . The most important being <code>P</code> , <code>Q</code> , <code>nn</code> , <code>num.nn</code> and

**Details**

Choose `N` ECA stations that are distributed evenly across the domain. Other options allow the stations to be selected based on a completeness criterion and/or which meet selected homogeneity characteristics.

**Value**

`data.table` object with coordinates of the selected stations

**Author(s)**

Richard Cornes

**Examples**

```
## Not run:
eobs <- readRDS("eobs.RDS")
neweobs <- test.stns(eobs, "PREC_19512013__homogeneity.txt")
saveRDS(neweobs, file="neweobs.RDS")

## End(Not run)
```

26

tprs

---

toDeci	<i>Convert a latitude/longitude string to decimal a value</i>
--------	---

---

**Description**

The input string must be in the format degrees:minutes:seconds

**Usage**

```
toDeci(x)
```

**Arguments**

x                      character string to be converted

**Value**

Coordinates in decimal degrees [numeric] to 2 decimal places. Since the input is in degrees, minutes, seconds, then this is a realistic precision, and is equivalent to a precision of 1.1132 km N/S & E/W at the equator, 1.0247 km E/W at 23N/S and 434.96 m E/W at 67N/S. See [http://en.wikipedia.org/wiki/Decimal\\_degrees](http://en.wikipedia.org/wiki/Decimal_degrees).

**Author(s)**

Richard Cornes

**Examples**

```
lat <- "52:20:27"
lat.dec <- toDeci(lat)
lon <- "01:25:00"
lon.dec <- toDeci(lon)
```

---

tprs	<i>Gridding using MGCV</i>
------	----------------------------

---

**Description**

Gridding using MGCV

**Usage**

```
tprs(obj, yvar = "VarSum^2", rhs = ~s(lon, lat) + s(I(alt/1000)),
     cost = 1, rev.trans = TRUE, family = gaussian(), se.fit = FALSE,
     cl = NULL)
```

*tpsr*

27

**Arguments**

<code>obj</code>	Object of class <code>eobs</code> or one of its derivatives
<code>yvar</code>	The left-hand side of the equation as a character string
<code>rhs</code>	The right-hand side of the equation as a formula
<code>cost</code>	Cost function supplied to <code>fitTps</code> function
<code>rev.trans</code>	If TRUE the values are converted back from a transformed state. For example, in the default case the values are returned as square-roots of the gridded values.
<code>family</code>	As specified for the <code>gam</code> function
<code>se.fit</code>	If FALSE standard error values are not calculated
<code>cl</code>	A cluster object

**Value**

An object of class `SpatialPointDataFrame`

**Author(s)**

Richard Cornes
